cutting edge of technology: Microcontrollers Fundamentals for Engineers and Scientists Steven Frank Barrett, Daniel J. Pack, 2006 Microcontrollers Fundamentals for Engineers and Scientists provides practicing scientists and engineers a tutorial on the fundamental concepts and the use of microcontrollers. Today, microcontrollers, or single integrated circuit (chip) computers, play critical roles in almost all instrumentation and control systems. There are a number of books that explore the fascinating world of microcontroller theory and applications. However, most of these are geared toward undergraduate and graduate students taking an electrical and/or computer engineering course. Furthermore, these texts have been written with a particular model of microcontroller as the target discussion. These textbooks also require a requisite knowledge of digital design fundamentals. In this textbook, authors Steven Barrett and Daniel Pack present the fundamental concepts common to all microcontrollers. The book presents the over-arching theory of microcontroller operation and provides a detailed discussion on constituent subsystems available in most microcontrollers. The text can be readily applied to a wide variety of microcontroller technologies, allowing practicing scientists and engineers to become acquainted with basic concepts prior to beginning a design involving a specific microcontroller. Both authors have used a wide variety of microcontrollers from various manufacturers and have found that the fundamental principles of a given microcontroller are easily transferred to other controllers. Although this is a relatively small textbook, it is packed with useful information and allows students and professionals to quickly come up to speed on microcontroller concepts.

cutting edge of technology: The Emerging High-Tech Consumer Allan Reddy, 1997-07-16 Who are the consumers of high-tech goods and services, and what will their needs and preferences be as we move into the next century? cutting edge of technology: Germany's Technological Performance H. Legler, G. Licht, A. Spielkamp, 2012-12-06 Maintaining the innovation capabilities of firms, employees and institutions is a key component for the generation of sustainable growth, employment, and high income in industrial societies. Gaining insights into the German innovation system and the institutional framework is as important to policy making as is data on the endowment of the German economy with factors fostering innovation and their recent development. Germany's Federal Ministry of Education and Research has repeatedly commissioned reports on the competitive strength of the German innovation system since the mid-eighties. The considerable attention that the public and the political, administrative and economic actors have paid to these reports in the past few years proves

the strong interest in the assessment of and indicators for the dynamics behind innovation activities. The present study closely follows the pattern of those carried out before. It has been extended, however, to include an extensive discussion on indicators for technological performance and an outline of the key features of the German innovation system.

cutting edge of technology: Education and Technological Unemployment Michael A. Peters, Petar Jandrić, Alexander J. Means, 2019-04-29 This book examines the challenge of accelerating automation, and argues that countering and adapting to this challenge requires new methodological, philosophical, scientific, sociological, economic, ethical, and political perspectives that fundamentally rethink the categories of work and education. What is required is political will and social vision to respond to the question: What is the role of education in a digital age characterized by potential mass technological unemployment? Today's technologies are beginning to cost more jobs than they create – and this trend will continue. There have been many proposed solutions to this problem, and they invariably involve an educational vision. Yet, in a world that simply doesn't offer enough work for everyone, education is clearly not a panacea for technological unemployment. This collection presents responses to this question from a wide spectrum of disciplines, including but not limited to education studies, philosophy, history, politics, sociology, psychology, and economics.

cutting edge of technology: Here and Now Graham Farmelo, Janet Carding, 1997 Presenting contemporary science and technology provides science museums and science centres with some of their greatest challenges. How can objects be more effectively displayed? And what are the key issues involved in developing exhibitions and events that address contemporary material?

cutting edge of technology: Taming Technology Hank Koerten, Henk Koerten, 2011 It is often assumed that innovative technology is an essential resource for the establishment of an information infrastructure. This study on geoinformation infrastructures convincingly demonstrates that technology is an important and far more complex factor than much geoinformation practitioners want us to believe. Three Dutch cases were studied, of which two were intended to develop an infrastructure deliberately applying innovative technology. Due to a constant stream of innovations these cases failed to bring about a working infrastructure. The third case was aimed at establishing a system of large-scale basemaps. These maps acted as a 'narrative anchor', a non-tangible interface between innovating technology and the infrastructure to be developed. Through the narrative anchor, this infrastructure has already existed for over 35 years and is likely to continue.

cutting edge of technology: China's Medium and Long-Term Science and Technology Program Zhenghong Chen, 2021-08-28 This book conducts a panoramic study on the history of China's Science and Technology which focuses on the Medium and Long-Term Science and Technology Program (MLSTP). In general these Programs have a duration of 5-30 year. This book provides an epochal assessment of the project's conceptual context over the past 60 years.. The author shows that the historical evolution and conceptual development of China's MLSTP are the result of an amalgamation of political, economic and social factors within distinct contemporary contexts. As a national action plan, MLSTP has incorporated many of the factors that go beyond the intentional factors of science and technology. MLSTP is not only a macro vision and blueprint for scientific and technological development; it is also a political act of realizing the national will. While ensuring the MLSTP builds on its great achievements, the author also reflects upon its deficiencies and disadvantages in order to better promote the advancement of science and technology in China. This book comprehensively lays out the historical and theoretical dimensions. Based on a clear vision of historical constructivism the author has compiled the MLSTP philosophy of different eras into a conceptual framework for this era and used this framework to research and analyze the historical and conceptual evolution of MLSTP. Research on MLSTP is important for as enrichment of contemporary studies in the history of science and the science and technology policy. In 2010, more than 60 years after the establishment of the People's Republic of China, the country had enacted 10 MLSTP programs. This book separates the development of the MLSTP into three different historical eras: the era of economic planning, the era of economic transformation and the new century. Each historical epoch corresponds to a different MLSTP philosophy concept, which enables us to study the conceptual evolution of MLSTP using historical research as our foundation.
