fordham university environmental science: International Horseshoe Crab Conservation and Research Efforts: 2007- 2020 John T. Tanacredi, Mark L. Botton, Paul K. S. Shin, Yumiko Iwasaki, Siu Gin Cheung, Kit Yue Kwan, Jennifer H. Mattei, 2022-07-13 The first International Conference on Horseshoe Crab's Conservation conducted at Dowling College, USA, (2007) and it's proceedings published by Springer in 2009, prompted the continued research and conservation efforts presented at subsequent conferences and colloquium in Hong Kong, Taiwan, (2011); San Diego, CA, (2014), (CERF); Japan, Sasebo (2015) and an accepted inclusion for a special session on Horseshoe Crabs at the 2017 CERF Conference held in Providence, RI, USA. All these aforementioned conferences contributed manuscripts, posters, workshop "position papers", and oral presentations the majority of which have not been published in total. In 2015, Carmichael et al. had published by Springer the majority of manuscripts from the 2011 Hong Kong / Taiwan conference. However, workshop results and all subsequent presentations and workshops were not. The Japan conference presented over 40 papers alone. A collection of all workshop summaries, poster presentations and new manuscript submittals (San Diego, CA; Sasebo, Japan; and Providence, RI) as well as products prepared for the IUCN World Congress in Hawaii, (2016), are included potential contributions for review in this compilation now available for global distribution in this Springer Nature publication. The "Proceedings of International Conferences on the Biology and Conservation of Horseshoe Crabs", thus contains over 50 manuscripts and a diversified collection of documents, photos and memorabilia covering all four of the horseshoe crab species globally: their biology, ecology evolution, educational, and societal importance. This book exposes the impacts that humans have imposed on all four of these species, revealing through the coordinated effort of horseshoe crab scientists with the IUCN, of the worldwide need for a clear conservative effort to protect these paleo- survival organisms from a looming extinction event. Biologists, conservationists, educators, and health professionals will all welcome this book not only for exploration of its pharmacological

interest, but also for the mystery of their longevity. This book also clarifies the future research needs and the conservation agenda for the species worldwide. Anyone working or studying estuaries on a global scale, will need to obtain this seminal work on horseshoe crabs.

fordham university environmental science: The Human and Environmental Impact of Fracking Madelon L. Finkel, 2015-03-24 Fracking for gas trapped in shale could be a game changer in the quest to find alternatives to dirty fossil fuels, but it also has potential for harm. This book provides one-stop shopping for everyone who wants to know more about the issues. Oil and gas account for a large percentage of the world's energy consumption, and the search for new ways to extract both from the earth is a global quest. Fracking is viewed as an energy game-changer but is a controversial topic about which there is much misunderstanding. This unbiased work was written to bring clarity to the issues. Under the guidance of an internationally recognized public health expert, this book provides a comprehensive look at unconventional natural gas development from many different perspectives. Written for the layperson, the book dispels myths surrounding fracking, corrects misconceptions, and offers impartial, scientifically based information on both benefits and challenges. Readers will learn about the effects fracking has on the environment—our water, air, and climate—as well as on human and animal health. The contributors also look at the economics of fracking and at its socioeconomic impact on local communities and nations. They discuss legal and ethical issues related to the practice and, in keeping with the intent to provide a fair and balanced overview, share the industry perspective as well.

fordham university environmental science: Gender and Environmental Education: Feminist and Other(ed) Perspectives Annette Gough, 2024-06-03 This timely book provides a starting point for critical analysis and discourse about the status of gendered perspectives in environmental education research. Through bringing together selected writings of Annette Gough, it documents the evolving discussions of gender in environmental education research since the mid-1990s, from its origins in putting women on the agenda through to women's relationships with nature and ecofeminism, as well as writings that engage with queer theory, intersectionality, assemblages, new materialisms, posthumanism and the more-than-human. The book is both a collection of Annette Gough, and her collaborators, writings around these themes and her reflections on the transitions that have occurred in the field of environmental education related to gender since the late 1980s, as well as her deliberations on future directions. An important new addition to the World Library of Educationists, this book foregrounds women, their environmental perspectives, and feminist and other gendered research, which have been marginalised for too long in environmental education.

fordham university environmental science: Tackling Marine Debris in the 21st Century

National Research Council, Division on Earth and Life Studies, Ocean Studies Board, Committee on the Effectiveness of International and National Measures to Prevent and Reduce Marine Debris and Its Impacts, 2009-01-17 Marine debris from ships and other ocean-based sources-including trash and lost fishing gear-contributes to the spoiling of beaches, fouling of surface waters and the seafloor, and harm to marine animals, among other effects. Unfortunately, international conventions and domestic laws intended to control marine debris have not been successful, in part because the laws, as written, provide little incentive to change behavior. This book identifies ways to reduce waste, improve waste disposal at ports, and strengthen the regulatory framework toward a goal of zero waste discharge into the marine environment. Progress will depend on a commitment to sustained funding and appropriate institutional support. The Interagency Marine Debris Coordinating Committee should, through planning and prioritization, target research to understand the sources, fates, and impacts of marine debris. It should support the establishment of scalable and statistically rigorous protocols that allow monitoring at a variety of temporal and spatial scales. These protocols should contain evaluative metrics that allow assessment of progress in marine debris mitigation. The United States, through leadership in the international arena, should provide technical assistance and support for the establishment of additional monitoring and research programs worldwide.

fordham university environmental science: Landscape Ecology in Theory and Practice Monica G. Turner, Robert H. Gardner, Robert V. O'Neill, 2007-05-08 An ideal text for students taking a course in landscape ecology. The book has been written by very well-known practitioners and pioneers in the new field of ecological analysis. Landscape ecology has emerged during the past two decades as a new and exciting level of ecological study. Environmental problems such as global climate change, land use change, habitat fragmentation and loss of biodiversity have required

ecologists to expand their traditional spatial and temporal scales and the widespread availability of remote imagery, geographic information systems, and desk top computing has permitted the development of spatially explicit analyses. In this new text book this new field of landscape ecology is given the first fully integrated treatment suitable for the student. Throughout, the theoretical developments, modeling approaches and results, and empirical data are merged together, so as not to introduce barriers to the synthesis of the various approaches that constitute an effective ecological synthesis. The book also emphasizes selected topic areas in which landscape ecology has made the most contributions to our understanding of ecological processes, as well as identifying areas where its contributions have been limited. Each chapter features questions for discussion as well as recommended reading.

fordham university environmental science: *The Routledge Handbook of Social Change*
Richard Ballard, Clive Barnett, 2022-09-30 The Routledge Handbook of Social Change provides an interdisciplinary primer to the intellectual approaches that hold the key to understanding the complexity of social change in the twenty-first century. We live in a world of intense social transformation, economic uncertainty, cultural innovations, and political turmoil. Established understandings of issues of well-being, development, democratisation, progress, and sustainability are being rethought both in academic scholarship and through everyday practice, organisation and mobilisation. The contributors to this handbook provide state-of-the-art introductions to current thinking on central conceptual and methodological approaches to the analysis of the transformations shaping economies, polities, and societies. Topics covered include social movements, NGOs, the changing nature of the state, environmental politics, human rights, anti-globalism, pandemic emergencies, post-Brexit politics, the politics of resilience, new technologies, and the proliferation of progressive and reactionary forms of identity politics. Drawing on disciplines including anthropology, human geography, political sociology, and development studies, this is a comprehensive and authoritative introduction to researching key issues raised by the challenge of making sense of the twenty-first century futures.

fordham university environmental science: *Contemporary French Environmental Thought in the Post-COVID-19 Era* Keith Moser, 2022-04-07 Contemporary French Environmental Thought in the Post-COVID-19 Era is focused on the fields of biosemiotics, linguistics, ecocriticism, and environmental ethics. Closely aligning with Sustainable Development Goal 13.1, Keith Moser's study aims to strengthen resilience to climate-related hazards by drawing on ecological theories developed by French philosophers in conversation with biosemiotic principles. Not only does the novel theoretical framework offered by biosemiotic interpretations of the universe and our place in it represent an indispensable conceptual tool for understanding the unprecedented medical challenges at the dawn of a new millennium, but it also beckons us to think harder about the environmental crisis that threatens the continued existence of all sentient beings who call the biosphere home. This book also highlights the richness, diversity, and utility of the ecological theories developed by the French philosophers Michel Serres, Edgar Morin, Jacques Derrida, Dominique Lestel, and Michel Onfray in addition to how they engage with biosemiotic principles. Taken together, the book probes the scientific, linguistic, philosophical, and ethical implications of biosemiotic theories in a post-pandemic world from an environmental and medical perspective.
