The development of different types of elite bilingual or multilingual educational provision is discussed and an argument is made for the need to study bilingual education in majority as well as in minority contexts.

form 2 science textbook: *Reading Actively in Middle Grade Science* Don K. Philpot, 2020-09-15 Middle grade students can learn a great deal about themselves and their world by reading informative texts in science courses. These texts will focus on important topics in earth science, life science, and physical science and shape students' understandings about scientific inquiry, science-related processes and phenomenon, engineering and design, and technological innovations. But reading is a complex act, and most students need specific reading-related support to understand assigned texts in middle grade science courses. This book focuses on the cyclical nature of reading, the actions proficient readers engage in to understand science textbooks and other informational texts, and the instructional support that teachers can provide to enhance middle grade students' learning of science content through reading. Three associated questions will be addressed in this book: •What actions do proficient readers engage in to understand assigned course texts? •What do these actions entail, and how do they relate to each other? • What teacher-mediated practices best support middle grade students' development as proficient readers and enhance their learning of course content through reading?

form 2 science textbook: *Early Learning of Modern Foreign Languages* Marianne Nikolov, 2009-02-27 Modern languages are offered to young learners at an increasingly early age in many countries; yet few publications have focused on what is available to children in different contexts. This volume fills this gap by documenting the state-of-the-art in researching young language learners using a variety of research methods. It demonstrates how young children progress and benefit from an early exposure to modern languages in different educational contexts, and how affective, cognitive, social, linguistic and classroom-related factors interact in the processes. A special strength is the range of languages: although English is the most widely learnt language, chapters focus on various target languages: Croatian, French, English, German, Italian, Spanish and Ukrainian and the contexts include China, Croatia, Greece, Hungary, Ireland, Norway, Poland, the Ukraine, and the United Kingdom.

form 2 science textbook: *Geoscience Education* Clara Vasconcelos, 2016-11-14 This book presents research in Geoscience Education focusing on indoor and outdoor environments in which teaching geoscience gains particular relevance, significance and contextualization. The research areas that are presented throughout the thirteen chapters cover a wide variety of subjects ranging from educational resources and fieldwork to science models. Chapters discuss specific geoscience topics such as earthquakes, rocks, fossils and minerals. Other chapters present a more interdisciplinary approach addressing topics that aren't usually examined, such as geomedicine and geoethics, with a specific focus on sustainable development and their alignment with the school curricula. Throughout the book readers can find research-based arguments illustrated with practical examples, which will help them to innovate in their curriculum development area, classroom practices and pre and in-service teachers' education. The book challenges readers to improve Geoscience Education by changing the ways of teaching, by enabling students to exploit their natural curiosity, and by spurring a learning process that should not be confined to the classroom but rather maintained throughout life.

form 2 science textbook: *Emergence in Context* Robert C. Bishop, Michael Silberstein, Mark Pexton, 2022 Science, philosophy of science, and metaphysics have long been concerned with the question of how order, stability, and novelty are possible and how they happen. How can order come out of disorder? This book introduces a new account, contextual emergence, seeking to answer these questions. The authors offer an alternative picture of the world with an alternative account of how novelty and order arise, and how both are possible. Contextual emergence is grounded primarily in the sciences as opposed to logic or metaphysics. It is both an explanatory and ontological account of emergence that gets beyond the impasse between weak and strong emergence in the emergence debates. It challenges the foundationalist or hierarchical picture of reality and emphasizes the ontological and explanatory fundamentality of multiscale stability conditions and their contextual constraints, often operating globally over interconnected, interdependent, and interacting entities and their multiscale relations. It also focuses on the conditions that make the existence, stability, and persistence of emergent systems and their states and observables possible. These conditions and constraints are irreducibly multiscale relations, so it is not surprising that scientific explanation is often multiscale. Such multiscale conditions act as gatekeepers for systems to access modal possibilities (e.g., reducing or enhancing a system's degrees of freedom). Using examples from

across the sciences, ranging from physics to biology to neuroscience and beyond, this book demonstrates that there is an empirically well-grounded, viable alternative to ontological reductionism coupled with explanatory anti-reductionism (weak emergence) and ontological disunity coupled with the impossibility of robust scientific explanation (strong emergence). Central metaphysics of science concerns are also addressed. *Emergence in Context: A Treatise in Twenty-First Century Natural Philosophy* is written primarily for philosophers of science, but also professional scientists from multiple disciplines who are interested in emergence and particularly in the metaphysics of science.
