Therefore, successful recovery of these patients is of paramount importance. Whilst the surgery itself is of utmost importance, insufficient or inappropriate pre-surgical work up and post-operative care may lead to reconstructive failures. Secondary reconstruction offers less optimal functional outcomes and may add to patient morbidity due to additional surgeries being required. This book serves as a comprehensive source of information related to the pre-, intra- and postoperative care of head and neck patients. It fills a critical need for a single source that addresses all aspects of perioperative management of head and neck patients.
