frontiers of environmental science engineering: Engineering Education John Heywood, 2006-01-24 A synthesis of nearly 2,000 articles to help make engineers better educators While a significant body of knowledge has evolved in the field of engineering education over the years, much of the published information has been restricted to scholarly journals and has not found a broad audience. This publication rectifies that situation by reviewing the findings of nearly 2,000 scholarly articles to help engineers become better educators, devise more effective curricula, and be more effective leaders and advocates in curriculum and research development. The author's first objective is to provide an illustrative review of research and development in engineering education since 1960. His second objective is, with the examples given, to encourage the practice of classroom assessment and research, and his third objective is to promote the idea of curriculum leadership. The publication is divided into four main parts: Part I demonstrates how the underpinnings of education—history, philosophy, psychology, sociology—determine the aims and objectives of the curriculum and the curriculum's internal structure, which integrates assessment, content, teaching, and learning Part II focuses on the curriculum itself, considering such key issues as content organization, trends, and change. A chapter on interdisciplinary and integrated study and a chapter on project and problem-based models of curriculum are included Part III examines problem solving, creativity, and design Part IV delves into teaching, assessment, and evaluation, beginning with a chapter on the lecture, cooperative learning, and teamwork The book ends with a brief, insightful forecast of the future of engineering education. Because this is a practical tool and reference for engineers, each chapter is self-contained and may be read independently of the others. Unlike other works in engineering education, which are generally intended for educational researchers, this publication is written not only for researchers in the field of engineering education, but also for all engineers who teach. All readers acquire a host of practical skills and knowledge in the fields of learning, philosophy, sociology, and history as they specifically apply to the process of engineering curriculum improvement and evaluation.

frontiers of environmental science engineering: Towards Rethinking Politics, Policy and Polity in the Anthropocene Hans Günter Brauch, 2025-02-24 Humankind faces two anthropogenic threats to its survival that are closely linked. The first is the end of the Holocene and the start of the Anthropocene, which was marked by the test of a nuclear bomb on 16 July 1945. In the prevailing peace and security narrative, nuclear weapons and the 'other' (country, bloc or alliance) pose a perceived threat to humankind's survival. In the Anthropocene narrative, 'we are the threat' through our way of life and the burning of fossil fuels. The start of the Anthropocene coincides with a change in the international order with the setting up of the UN and the Bretton Woods Institutions. Three stages of this order are distinguished: the Cold War (bipolarity), the post-Cold War era (unipolarity), and the end of the rule-based global liberal order (multipolarity) on 24 February 2022. In this book ten multidisciplinary perspectives discuss complexity, Anthropocene geopolitics, peace and security discourses and the debate on the Anthropocene, planetary boundaries, complex crises and integrative geography in the Anthropocene, governance and politics, and the Patriacene and gender. Both existential threats for humankind are illustrated by cover photos of the first nuclear weapons test on 16 July 1945 and by Category 5 Hurricane Otis, an extreme weather event impacting on Acapulco in Mexico on 25 October 2023. The Anthropocene as a new epoch of Earth history coincides in 1945 with a change in the international order. In the security and peace narrative, the 'other' and nuclear weapons pose an existential threat; in the Anthropocene narrative. This dual existential change requires a rethinking of politics, policy and polity. In the social sciences, the Anthropocene is being discussed from multidisciplinary perspectives (geography, political science, and peace, security, and gender studies). This is an open access publication.

frontiers of environmental science engineering: Emerging Contaminants in Water and Wastewater Himanshu Gupta, Sughosh Madhav, Soniya Dhiman, Ritu Mishra, 2025-02-09 This present book serves as a comprehensive compilation of various emerging contaminants in the ecosystem, their contamination risk as well as the applicable remediation techniques. Exploding urbanization and industrialization often combined with improved standards of living have resulted in deleterious effects on the quality of the environment. Due to rapid growth of industrialization in the past few decades, large amounts of undesirable wastes are being discharged into the environment threatening the survival of living beings on the earth. In the recent years, the problems regarding pollution have become more global, and awareness about the environmental problems is increasing continuously. Environmental awakening has led many scientists to focus on the assessment of environmental impact of various emerging contaminants. The first victims of the environmental pollution are the terrestrial plants and aquatic bodies in the vicinity of urban areas that experience heavy pollution due to industrial effluents, toxic chemicals, hospital waste, radioactive waste, industrial fumes, vehicular traffic, etc. The increasing industrialization and use of hazardous chemicals are responsible for the lack of access to clean water in many parts of the world. In view of the widespread occurrence, persistence, and harmful effects of environmental pollutants on human population, the present book is proposed. Emerging contaminants due to ubiquitous distribution, persistence, and toxic effects have necessitated the development of efficient methods for remediation of contamination. Reports appearing from time to time reveal that the number and concentration of contaminants in the environment are continuously increasing. Thus, development as well as dissemination of new and eco-friendly methods for the removal of these pollutants has become a challenging task.
