Matrix and Related Concepts

The term "matrix" is one of the most commonly used math terms that start with m, especially in linear algebra. A matrix is a rectangular array of numbers, symbols, or expressions arranged in rows and columns. Matrices are fundamental in solving systems of linear equations, transforming geometric data, and representing data structures in computer science.

Matrix

A matrix is defined by its dimensions, typically denoted as $m \times n$, where m represents the number of rows and n the number of columns. Matrices can be added, subtracted, and multiplied under certain conditions, and they play a critical role in various applications including computer graphics, engineering, and physics.

Matrix Multiplication

Matrix multiplication is a binary operation that produces a new matrix from two matrices. This operation is not commutative, meaning that the order in which matrices are multiplied matters. For two matrices A (of size $m \times n$) and B (of size $n \times p$), their product is a matrix of size $m \times p$.

Minor of a Matrix

The minor of an element in a matrix is the determinant of the smaller matrix that remains after deleting the row and column of that element. Minors are used in calculating the determinant of larger matrices and in finding the inverse of a matrix.

- Matrix: Rectangular array of elements arranged in rows and columns.
- Matrix multiplication: Operation producing a product matrix from two matrices.
- Minor: Determinant of a submatrix formed by removing one row and one column.

Measures and Metrics

Measures and metrics are crucial math terms that start with m, often used in statistics, geometry, and measurement theory. These terms help quantify, compare, and analyze mathematical objects and data sets.

Mean

The mean is a measure of central tendency that represents the average value in a set of numbers. It is calculated by summing all values and dividing by the count of values. The mean is widely used in statistics to summarize data.

Median

The median is another measure of central tendency, representing the middle value in an ordered data set. Unlike the mean, the median is less affected by extreme values or outliers, making it a robust measure for skewed distributions.

Modulus

In mathematics, modulus has several meanings depending on context. In complex numbers, modulus refers to the magnitude or absolute value of a complex number. In number theory, it relates to the remainder after division, as in modular arithmetic.

Metric

A metric is a function that defines a distance between elements in a set, satisfying specific properties like non-negativity, identity of indiscernibles, symmetry, and the triangle inequality. Metrics are foundational in topology and analysis.

- Mean: Arithmetic average of a data set.
- Median: Middle value in an ordered data set.
- Modulus: Magnitude of a complex number or remainder in division.
- Metric: Function defining distance in mathematical spaces.

Mathematical Operations and Properties

Mathematical operations and properties beginning with m are vital for understanding mathematical processes and behaviors. These terms often describe the nature of operations, their results, or characteristics of mathematical objects.

Multiplication

Multiplication is one of the basic arithmetic operations representing repeated addition. It is commutative and associative for real numbers and forms the basis for more complex operations in various math fields.

Modulo Operation

The modulo operation, often denoted as mod, finds the remainder after division of one number by another. It is fundamental in number theory, cryptography, and computer science algorithms.

Monotonic Function

A monotonic function is a function that is either entirely non-increasing or non-decreasing throughout its domain. Monotonicity is an important property in calculus and analysis, simplifying the study of function behavior.

- Multiplication: Arithmetic operation representing repeated addition.
- Modulo Operation: Operation yielding the remainder after division.
- Monotonic Function: Function that consistently increases or decreases.

Mathematical Structures and Theories

Mathematical structures and theories starting with m provide frameworks for understanding complex mathematical concepts and relationships. These terms often appear in higher mathematics, including abstract algebra and geometry.

Manifold

A manifold is a topological space that locally resembles Euclidean space. Manifolds are central in differential geometry and theoretical physics, providing a way to study curved spaces and surfaces.

Module

In abstract algebra, a module generalizes the notion of vector spaces by allowing scalars to come from a ring instead of a field. Modules are essential in ring theory and homological algebra.

Monoid

A monoid is an algebraic structure with an associative binary operation and an identity element. Monoids are important in computer science, particularly in automata theory and formal languages.

- Manifold: Space that locally resembles Euclidean space.
- Module: Generalization of vector spaces over a ring.
- Monoid: Algebraic structure with associative operation and identity.

Miscellaneous Math Terms Starting with M

This section covers additional math terms that start with m, which do not fit neatly into previous categories but are nonetheless important in various mathematical contexts.

Markov Chain

A Markov chain is a stochastic process that undergoes transitions from one state to another in a state space, with the probability of each state depending only on the previous state. It has applications in statistics, economics, and computer science.

Matrix Determinant

The determinant is a scalar value derived from a square matrix that provides important properties about the matrix, such as invertibility and volume scaling in transformations.

Mean Value Theorem

The Mean Value Theorem is a fundamental theorem in calculus stating that for a continuous function on a closed interval, there exists at least one point where the derivative equals the average rate of change over that interval.

- Markov Chain: Stochastic process with memoryless transitions.
- Matrix Determinant: Scalar value indicating matrix properties.
- Mean Value Theorem: Calculus theorem relating derivatives and averages.

math terms that start with m: Encyclopaedia of Mathematics Michiel Hazewinkel, 2013-12-01 This ENCYCLOPAEDIA OF MATHEMATICS aims to be a reference work for all parts of mathematics. It is a translation with updates and editorial comments of the Soviet Mathematical Encyclopaedia published by 'Soviet Encyclopaedia Publishing House' in five volumes in 1977-1985. The annotated translation consists of ten volumes including a special index volume. There are three kinds of articles in this ENCYCLOPAEDIA. First of all there are survey-type articles dealing with the

various main directions in mathematics (where a rather fine subdivision has been used). The main requirement for these articles has been that they should give a reasonably complete up-to-date account of the current state of affairs in these areas and that they should be maximally accessible. On the whole, these articles should be understandable to mathematics students in their first specialization years, to graduates from other mathematical areas and, depending on the specific subject, to specialists in other domains of science, engineers and teachers of mathematics. These articles treat their material at a fairly general level and aim to give an idea of the kind of problems, techniques and concepts involved in the area in question. They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions. The second kind of article, of medium length, contains more detailed concrete problems, results and techniques.
