matrix pain management pc: *Advancement in Equine Pain Management* Ludovica Chiavaccini, Rachel Anne Reed, Claudia Spadavecchia, 2025-02-17 Despite recent improvements in the perception of equine pain and welfare, the recognition and treatment of pain in horses still lag behind their small animal counterpart. While most clinicians strongly advocate preventing and alleviating pain, it is still debated whether a little discomfort may reduce the risk that the animal will overuse an injured body part, especially in prey animals like horses. In addition, the reluctance to use systemic full mu-opioid receptor agonists still exists due to the concern that opioids may cause excitation, the fear that opioid receptor agonists may decrease gastrointestinal motility, and the conflicting data on the analgesic efficacy of full mu opioids in horses with naturally occurring diseases. Therefore, this special issue will revolve around recent advancements in equine pain understanding, recognition and management. Authors are encouraged to submit papers in the areas of recognizing, preventing, modulating, and managing acute and chronic pain in horses. We also encourage submissions focusing on pain mechanisms, such as mechanistic studies ex vivo or preliminary work involving tissues or biological samples from well-phenotyped horses. Finally, we note significant advancements in the development of therapeutic platforms, viral transfection modalities, or targeted neurotoxins that have been documented on other species and suggest relevance to the equine patient.

matrix pain management pc: Translational Pain Research: Comparing preclinical studies and clinical pain management. Lost in translation? Jianren Mao, 2006 Basic science and clinical pain research is particularly challenging for several reasons. First, pain is a subjective experience in response to nociception that follows actual or potential tissue damage. Since the ability to respond to this warning signal is essential for our survival, the nociceptive system that produces and transmits nociceptive signals is remarkably redundant and involves diffuse regions of the central nervous system. Second, unlike other sensory modalities, pain is a multi-dimensional experience including at least cognitive, affective, and sensory-discriminative components. Third, pain experiences can be influenced by psychological, socioeconomic, cultural, and genetic predispositions, making it exceedingly complicated to study pain and pain modulation. The topics covered in this volume are carefully selected and directly related to the daily practice of pain medicine. These topics include 1) central mechanisms of pain and pain modulation (Dickenson, Donovan-Rodriguez, Matthews) and clinical use of ion channel blockers (Chen); 2) spinal glutamatergic mechanisms (Guo, Dubner, Ren) and issues related to glutamate receptor antagonists in pain management (Mao); 3) basic science of opioid analgesics (Gintzler, Chakrabarti) and clinical opioid use (Smith, McClean); 4) inflammatory cytokines (Samad) and clinical use of anti-inflammatory drugs (Fink, Brenner); 5) role of the sympathetic nervous system in pain mechanisms and its relation to clinical pain management (Sharma, Raja); 6) preclinical studies on tricyclic antidepressants (Gerner, Wang) and clinical use of antidepressants in pain management (Greenberg); 7) developing pain pathways and analgesic mechanisms during the developmental stage (Fitzgerald) and challenges of pediatric pain management (Lebel); 8) basic science mechanisms of serotonin agonists and their use in the clinical management of migraine headache (Biondi); 9) clinical research on gender differences in clinical pain and their implications for clinical pain management (Holdcroft); 10) current modalities of clinical cancer pain management (Popescu, Hord); and 11) preclinical and clinical information on alternative medicine (Chen).
