med 360 health urgent care: **Acute Medicine in the Frail Elderly** Henry Woodford, James George, 2021-06-09 Frail older people now contribute the majority of the acute emergency take both medical and surgical. Despite this there is often a lack of confidence and knowledge among doctors and nurses in treating older people in the Emergency Department and on Emergency Assessment Units. From the Preface Emergency care of frail older people is challenging but very rewarding. Older patients tend to be complex and therefore their assessment needs to be more extensive and include comprehensive geriatric assessment. It is the extras in their assessment that are not usually needed in younger patients, such as cognitive, functional and social evaluations that make the difference in achieving a better outcome. This book describes the key features of high quality care for frail elderly patients in acute hospital settings. With chapters on assessment and the characteristic non-specific ways that patients tend to present (such as 'confusion', 'collapse query cause' and 'off legs'), this practical guide is ideal to have on-hand. As well as common medical and surgical conditions, it also covers medication management, elder abuse, pressure ulcers and hypothermia, including the physiological changes seen in ageing and ways to define frail patients. Tables, diagrams and images are ideal for quick reference, and key points are summarised throughout the text to aid comprehension, providing doctors, nurses and therapists with both background and essential information to provide the excellent acute care older people deserve.

med 360 health urgent care: *Antimicrobial Stewardship in Non-Traditional Settings* Shira Doron, Maureen Campion, 2023-03-01 The evolution of Antimicrobial Resistance is outpacing the ability to create novel antibiotics, which is proving to be a global problem in the face of climate change, population growth, demographic shifts toward aging populations, emerging infections, and other crises. Therefore, clinicians are forced to use the existing antimicrobials more responsibly to preserve their longevity for generations to come. In a parallel vein, there has been a recent regulatory acknowledgement of the importance of prudent antimicrobial prescribing, mandating the implementation of Antimicrobial Stewardship across all healthcare settings. This is harder to manage in a non-traditional setting, which include long-term care facilities, outpatient care clinics, urgent care centers, and others. Given the trends in patient care in these settings—particularly where the aging community is concerned—this is proving to be a growing problem. This is troublesome even for spaces that have university and large hospital affiliations. There is a plethora of data describing the implementation and outcomes of Antimicrobial Stewardship Programs in acute-care hospitals with open-access, evidence-based guidelines endorsed by the Infectious Diseases Society of America. However, non-traditional settings often find themselves struggling to implement the same practices and procedures due to their unique needs and limited resources. There may be variability in access to resources, applicability, and patient-type. This book seeks to inform those in non-traditional healthcare settings on the principles, practice, and outcomes of Antimicrobial Stewardship Programs to improve patient care across all settings. The text begins by unpacking Antimicrobial Stewardship in nontraditional settings then covers specific environments, including long-term care facilities, outpatient clinics, and emergency departments. The text also covers special topics, including veterinary medicine, HIV, oncology, and immunocompromised patients, pediatrics, neonates, transplant, and critical care patients.

2013-03-15 Low- and middle-income countries have seen a dramatic rise in the incidence of breast and gynecological cancers in the past decade. Organized cancer screening programs are not widely available in developing countries, leading to disproportionately higher mortality rates compared to those in the developed world. This book addresses cost-effective strategies for implementing programs aimed at screening for the early detection of breast, cervical, endometrial, and ovarian cancers. A well woman clinic concept providing such services as part of women's health examinations is proposed, aiming to ensure patient compliance by limiting clinic visits required for initial testing and diagnosis of screen positive cases.
