medical student summer research programs: Success for All Melisa N. Choroszy, Theodor M. Meek, 2020-04-15 While the most important measure of success for many degree-seeking students is the timely attainment of a Bachelor's degree, there remains a host of other indicators of student success that vary by student population and students' personal goals. Many of these smaller successes lead to the ultimate goal of graduation and are significant triumphs throughout the journey through higher education. *Success for All* is a strategic guide for administrators and educators that offers methods for advising students through the myriad of challenges they face. Every bit of success contributes to the accomplishment of a larger goal, and this book highlights success at every level. Administrators and educators demonstrate how these programs help make a positive contribution to the students and the institutions they serve while implementing practical solutions to increase graduation rates.

medical student summer research programs: The Diversity Machine Frederick R. Lynch, 2017-07-05 Diversity has become the turn-of-the-century buzzword. Republican and Democratic

leaders ritually chant diversity is our strength and corporate CEOs talk about the need to create a workforce that looks like America. Most corporate mission statements now contain a clause on valuing differences and millions of employees have completed-or soon will undergo-some sort of diversity training. Where did all this come from -and why? Who created diversity programs? How do they differ? How effective are these policies? Can they do more harm than good in organizations and in the wider society? During the past decade, sociologist Frederick R. Lynch studied the rise of a social policy movement that has successfully moved multiculturalism from universities and foundations into the courts, mass media, and the American workplace. The new diversity policies are future-oriented and market-driven, eclipsing old affirmative action debates about overcoming past discrimination against blacks. Based on more than six years of field research and hundreds of interviews, Lynch tracks the development and impact of different forms of diversity policies at dozens of consultant gatherings, in the business and professional literature and through in-depth case studies such as the Los Angeles Sheriff's Department and the University of Michigan, Ann Arbor. He profiles the major consultants who have powered the diversity machine, analyzes the benefits and drawbacks of various approaches to workplace diversity and provides numerous you-are-there samples of workshops, seminars, and conferences. The book is written for the general reader interested in public-policy issues, social scientists, and others interested in the origins and consequences of workplace diversity policies.

medical student summer research programs: *Achieving Equity in Neurological Practice*
Bruce Ovbiagele, Sharon Lewis, Daniel José Correa, Reena Thomas, Larry Charleston IV, 2024-10-22
The recent high-profile murders of George Floyd, and other African American individuals, along with the prevailing coronavirus disease (COVID-19) pandemic have reinforced the notion that certain marginalized populations have worse health outcomes than other populations, likely due to unequal and unjust policies and practices. Neurological processes and prognoses frequently vary by sex/gender, race/ethnicity, socioeconomic status, and geographic location. In particular, individuals of lower socioeconomic status and from minority racial and ethnic backgrounds have worse neurological health and often receive a lower standard of neurological care. These inequities in neurological outcomes are attributed to wider societal social influences, which impact how people live and how neurology is practiced. Published evidence suggests that healthcare providers and the healthcare system contribute to inequities in neurological care for vulnerable and underserved populations. However, educating neurology care providers about these issues and training them to provide equitable care for these patients can potentially improve neurology care access, delivery, and outcomes. In this book we provide the theoretical background, scientific evidence, and experiential knowledge warranted to properly care for vulnerable, underserved patients with neurological diseases at the levels of the provider and system. This book examines the root causes of neurological health inequities across a broad range of topics and offers possible solutions for achieving neurological health equity. Initial chapters help to frame the overall issue of neurological health equity. Subsequent chapters evaluate neurological health equity from the clinical practice standpoint, with a focus on select populations and subspecialty care delivery settings. Lastly, we discuss the bigger picture with regard to the pipeline of practitioners and purview of policy makers. This text is relevant for neurology residents and fellows, multidisciplinary neurological care practitioners (neurologists, neurosurgeons, advanced practice providers, hospitalists, emergency physicians, critical care physicians, pharmacists, and allied health personnel), and public health researchers and health policy makers. The book is divided into three sections: Principles, Neurological Conditions, and Priorities. The first section establishes the framework and explains various key terminologies and concepts, which undergird the care of vulnerable and undeserved patient populations. The second section, Neurological Conditions, covers key neurological diseases by sub-specialty describing published evidence of care and outcome disparities, gaps in knowledge, practical techniques for bridging these disparities on provider and system levels. The third section, Priorities, identifies important areas of focus and improvement targeting trainees, researchers, community partners, stakeholder organizations and policy makers, which would be crucial for

implementing sustained societal-level enhancements in the neurological health of these vulnerable populations.
