teacher strategies gold app: Investigating Water With Young Children (Ages 3-8) Beth Dykstra Van Meeteren, 2023 Water is a meaningful context for children to engage in inquiry and acquire and use science and engineering practices, such as developing spatial thinking and early concepts of water dynamics. This book shows teachers how to engage children with opportunities to engineer water movement through pouring and filling containers of various kinds and shapes, observing how water interacts with surfaces in large and small amounts, exploring how water can be moved, and using water to move objects. These experiences build a foundation that will support children's more complex study of this phenomena in later schooling, as well as encourage interest in STEM fields. The text provides guidance for arranging the physical, intellectual, social-emotional, and promotional environments of the early childhood classroom; for integrating literacy learning; and for building essential partnerships with administrators and families to enhance STEM learning for our youngest learners. Book Features: Introduces WaterWorks, an integrative STEM experience developed by young children, their teachers, and early childhood researchers. Describes an approach that engages children in doing science and engineering, rather than teaching children about these fields. Offers children the opportunity to engage in STEM experiences every day in their classrooms alongside literacy learning. Illustrates ways to plan and use over ten types of engineering experiences appropriate for children ages 3-8. Includes guidance for documenting children's learning over time. Aligns to the Early Learning Outcomes Framework and the Next Generation Science Standards. Contributors: Allison Barness, Shelly L. Counsell, Lawrence Escalada, Judith Finkelstein, Linda Fitzgerald, Sherri Peterson, Jull Uhlenberg, and Wendy Miller. Praise for the

STEM for Our Youngest Learners Series: “This series is an important addition to a very limited field of guides for teaching STEM to young learners. While activity books abound, this series, with its basis in constructivism and its use of an inquiry-based teaching model, guides teachers in creating in-depth experiences for children to examine the natural world while building their critical thinking skills and deepening their curiosity about and interest in the world around them.” —Karen Worth, consultant in science education, early childhood and elementary years

teacher strategies gold app: *Advancing Research on Teachers' Professional Vision: Implementing novel Technologies, Methods and Theories* Christian Kosel, Tina Seidel, Christian Hartmann, Ann-Sophie Grub, 2024-07-25 A classroom full of students can be overwhelming for teachers. It is critical that teachers are able to filter and meaningfully interpret the relevant information in this complex scenario. Much of this filtering and interpretation occurs through selective visual perception. Over the last decade, a rapidly growing number of studies in empirical educational research used eye tracking to investigate teachers' selective visual perceptual processes in the classroom. Theoretically, visual attention and perception are often conceptualized as knowledge-based noticing coupled with knowledge-based reasoning about what is visually perceived. Recent eye-tracking studies have shown that experienced teachers, in particular, show improved selective attention of classroom events through faster detection of relevant information and improved monitoring of learning-relevant situations. Researchers agree that a critical driver of selective attention processes is the professional knowledge (declarative, procedural, and metacognitive) of (experienced) teachers, which controls selective perceptual processes in a top-down process. The findings are significant and provide important insights for research on teacher professionalization.
