technology in society stanford: *Nature, Technology, and Society* Victor Ferkiss, 1994-11
Traces cultural attitudes toward the environment and technology across the span of human civilization While all human societies have enlisted technologies to control nature, the last hundred years have witnessed the technological exploitation and destruction of natural resources on an unprecedented scale. As environmental groups and the scientific community sound the alarm about deforestation, global warming, and ozone depletion, the obvious question arises: how did we get where we are today? In *Nature, Technology, and Society*, Victor Ferkiss sets out to answer this central question, arguing that we cannot escape from our present environmental predicament unless we understand the ideas which have created it. Ferkiss asks the basic questions concerning humans and their relationship to the environment. He traces cultural attitudes towards the environment from early mankind to the present day. This fascinating book is distinctive both in its comprehensiveness, and in its attempt to place side by side influential thinkers and movements with varied views on these issues.

technology in society stanford: *Faith, Hope, and Love in the Technological Society* Franz A. Foltz, Frederick A. Foltz, 2018-07-31 Franz and Frederick Foltz examine how modern technology creates an environment that significantly affects Christianity by reducing the mysteries of faith to manageable techniques. The body of their work analyzes the effects of technology on the theological virtues of faith, hope, and love, the triad that believers have used for a common narrative to understand and express their thoughts and experiences. They begin by looking at how recent developments have brought us into a post-truth era by removing words from their context in nature, time, place, and community. Popular theologies such as the power of positive thinking, the laws of creation, the plan for salvation, and the prosperity gospel reflect this change by gearing all for efficiently getting what we want and ignoring tradition. The authors then examine each of the virtues separately, finding that faith has become a risk management tool that depends on confidence in systems rather than personal relationships, hope is defined as the expectation that our present desires shall be granted rather than a vision of the future, and love has become an intimacy that provides escape from the real world and community rather than a self-denying care for them. Finally, the authors take a look at some appropriate responses.

technology in society stanford: Science, Technology, and Society David D. Kumar, Daryl E. Chubin, 2012-12-06 David D. Kumar and Daryl E. Chubin We live in an information age. Technology abounds: information technology, communication technology, learning technology. As a once popular song went, Something's happening here, but it's just not exactly clear. The world appears to be a smaller, less remote place. We live in it, but we are not necessarily closely tied to it. We lack a satisfactory understanding of it. So we are left with a paradox: In an information age, information alone will neither inform nor improve us as citizens nor our democracy, society, or institutions. No, improvement will take some effort. It is a heavy burden to be reflective, indeed analytical, and disciplined but only constructively constrained by different perspectives. The science-based technology that makes for the complexity, controversy, and uncertainty of life sows the seeds of understanding in Science, Technology, and Society. STS, as it is known, encompasses a hybrid area of scholarship now nearly three decades old. As D. R. Sarewitz, a former geologist now congressional staffer and an author, put it After all, the important and often controversial policy dilemmas posed by issues such as nuclear energy, toxic waste disposal, global climate change, or biotechnology cannot be resolved by authoritative scientific knowledge; instead, they must involve a balancing of technical considerations with other criteria that are explicitly nonscientific: ethics, esthetics, equity, ideology. Trade-offs must be made in light of inevitable uncertainties (Sarewitz, 1996, p. 182).

technology in society stanford: Technology, Society and Sustainability Lech W. Zacher, 2017-03-02 This collection is a multidisciplinary and multicultural contribution to the current sustainability discourse. It is focused on two main dimensions of our world: complexity and diversity. Desirable and urgent transition of socio-technological systems toward a sustainability trajectory of development requires a better understanding of technological trends and social transformations. General advancement of technology does not produce identical changes in various societies, differentiated economically and culturally. Moreover, the abilities to approach sustainable development change over time and space. As a result there is a constant need for continuing research, analyses, and discussions concerning changing contexts and adequacy of strategies and policies. Authors from twelve countries and of different academic and cultural settings present their insights, analyses and recommendations. The collection is focused both on contexts and on activities leading to sustainable trajectories in various domains of economy and social life. Continuing research and discussion is needed to better understand these challenges and to prepare the appropriate strategies and solutions. Development of socio-technological systems is nowadays very complex; moreover, the world we live in is extremely diverse. Therefore, sustainability discourse must be ongoing, introducing new ideas, concepts, theories, evidence and experience by various parties—academics, professionals, and practitioners.

technology in society stanford: *Living in the Labyrinth of Technology* Willem H. Vanderburg, 2005-12-15 From the very beginnings of their existence, human beings have distinguished themselves from other animals by not taking immediate experience for granted. Everything was symbolized according to its meaning and value: a fallen branch from a tree became a lever; a tree trunk floating in the river became a canoe. Homo logos created communities based on cultures: humanity's first megaproject. Further symbolization of the human community and its relation to nature led to the possibility of creating societies and civilizations. Everything changed as these interposed themselves between the group and nature. Homo societas created ways of life able to give meaning, direction, and purpose to many groups by means of very different cultures: humanity's second megaproject. What Das Kapital did for the nineteenth century and La technique did for the twentieth, Willem H. Vanderburg's *Living in the Labyrinth of Technology* seeks to create for the twenty-first century: an attempt at understanding the world in a manner not shackled to overspecialized scientific knowing and technical doing. Western civilization may well be creating humanity's third megaproject, based not on symbolization for making sense of and living in the world, but on highly specialized desymbolized knowing stripped of all peripheral understanding. Vanderburg focuses on two interdependent forces in his narrative, namely, people changing technology and technology changing people. The latter aspect, although rarely considered, turns out to be the more critical one for understanding the spectacular successes and failures of contemporary ways of life. As technology continues to change the social and physical world, the experiences of this world 'grow' people's minds and society's cultures, thereby re-creating human life in the image of technology. *Living in the Labyrinth of Technology* argues that the twenty-first century will be dominated by this pattern unless society intervenes on human (as opposed to technical) terms.

technology in society stanford: *The End of Ethics in a Technological Society* Lawrence E.

Schmidt, Scott Marratto, 2008-02-06 Lawrence Schmidt and Scott Marratto challenge modern liberal ethics, arguing that there is no consistent ethical framework to deal with the long-range negative consequences of certain technological developments. They examine established ethical approaches to such urgent contemporary concerns as environmental degradation, nuclear energy, high tech militarism, and fetal genetic testing, showing that the prevailing viewpoint valorizes autonomy above all other goods and considers technological advances as mere extensions of the range of human freedoms. Modern ethics thus fails to take into account the moral intuition that some possibilities in the realm of techno science simply ought not to be pursued. A comprehensive assessment of modern western society's commitment to technological progress, *The End of Ethics in a Technological Society* presents a convincing argument in favour of a post-liberal approach - one that rejects the ideology of progress, supports caution, and accepts limitation.
