who is more likely to questions for friends: National Survey Results on Drug Use from the Monitoring the Future Study, 1975-1993: Secondary school students Lloyd Johnston, Patrick M. O'Malley, Jerald G. Bachman, 1994 This report summarizes a national survey of drug use and related attitudes among American secondary school students. All of its data came from an ongoing national research and reporting program entitled, Monitoring the Future: A Continuing Study of the Lifestyles and Values of Youth. These surveys address two major topics: (1) the prevalence of drug use among American students in 8th, 10th, and 12th grades; and (2) drug use trends by those students. Distinctions were drawn among demographic subgroups, incidence of first use recorded, trends in use at lower grade levels, and intensity of drug use. Also included were key attitudes about illicit drug use--incorporating perceptions of the social environment--as potential explanatory factors. The research focused on frequent drug use rather than analyzing everyone who has ever used drugs. This strategy serves to differentiate levels of seriousness, or extent, of drug involvement. Survey results indicate that the last decade witnessed an appreciable decrease in the use of numerous illicit drugs among seniors. However, eighth-graders exhibited a significant increase in some drug use, such as marijuana, cocaine, and LSD. This latter evidence may indicate that younger cohorts have less opportunity to learn through informal means about the dangers of drugs. Two appendixes present the prevalence and trend estimates adjusted for absentees and dropouts, and definitions of background and demographic subgroups. (RJM)

who is more likely to questions for friends: Understanding Youth Crime Mark Lynch, 2017-07-12 This title was first published in 2003. Adolescence is popularly understood as a transitional phase of turbulence and extremes. It is also often associated with 'trouble'. Criminal justice statistics, however, reveal that youth criminality remains a relatively rare phenomenon, less than one percent of the total adolescent population in any given year. This exceptional book is based upon a major Australian research programme to consider the key social factors impacting upon the lives of young people. A sample of 1,300 young people was divided into three major subgroups: a 'control' group, drawn from state secondary schools and closely approximating the general population; a chronically marginalized cohort representing a 'vulnerable group', and a group of offenders, most of whom were incarcerated at the time of the research. With its rich data source and highly integrated structure, the book makes a major contribution to our understanding of adolescent criminality and associated policy both in Australia and internationally.
